

Supervisor - Cockpit Variables

Introduction

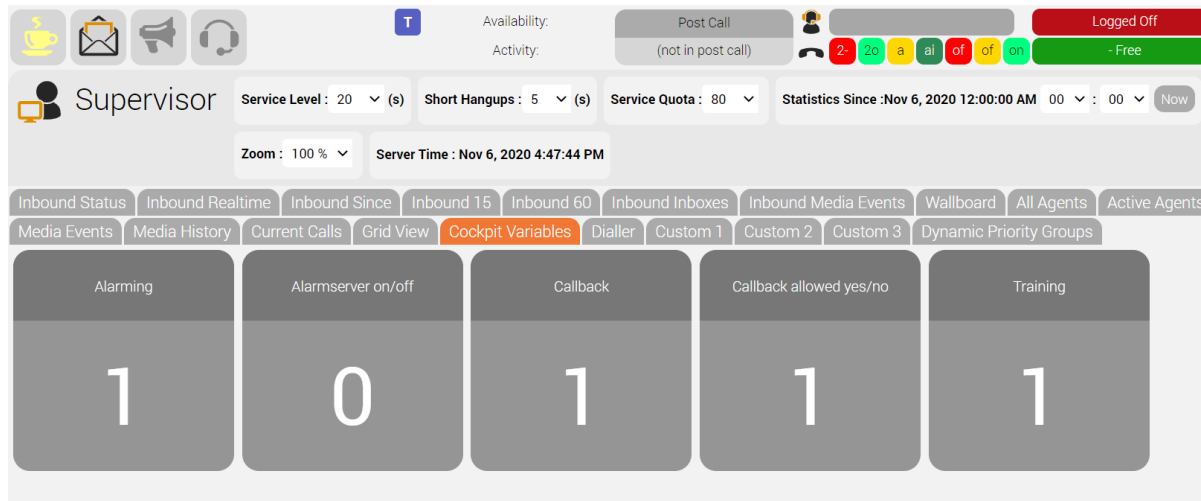

Cockpit variables serve as system wide variables that can influence the routing in various ways.

See also [Cockpit Variables](#).

Cockpit variables often serve as switches or counters.

In the supervisor view, the value or counter of the cockpit variable is displayed so that the supervisor can see how the routing is currently influenced.

Example

- The cockpit variable for the alarm server is enabled.
- A works meeting is in progress.
- There currently is no gas leak
