

TTS Exception Lexica

You can use TTS Exception Lexica to modify the pronunciation of the existing TTS engines.

Note: This section does not discuss the format of the individual exception lexica; this is provided with the TTS engine documentation.

Choose **Prompt Management - TTS Exception Lexica** to view a table of the existing lexica. To create a new lexicon, click on **New** in the toolbar. Provide the following information:

Manufacturer	The manufacturer of the TTS engine
Language	The language of the TTS engine
Gender	The gender of the speaker of the TTS engine
Speaker Name	The name of the speaker of the TTS engine
File	Choose a lexicon file. Then click on Upload .

The values for manufacturer, language, gender and speaker name are used to match the TTS engine. If a lexicon is created without specifying a specific speaker or gender, then it applies to all engines of the respective manufacturer for the selected language.

After entry and uploading the file, click on **Save**.

In the list of existing TTS Exception Lexica use **Edit** to modify the data, **Download** to retrieve the lexicon file, and **Delete** to remove the respective entry.
