

# Editing Routing Applications

To edit a routing application use the function **Routing - Routing Applications** in the main menu and click on **Edit** in the table of applications. You will be shown the table of versions of the particular application. The table shows some status data on each particular version.

For every version the following actions are available:

**Active** - activates the selected version of the application, callers will access this application when calling the system.

**Test** - sets the selected version of the application as the test application, callers from the Test CLI will access this application when calling the system. This is a useful feature enabling programmers to modify a running application. The modified application can be tested without using a separate service number. All other callers will access the active version of the application.

**Edit** - opens the graphical editor for this version. Editing a routing application always involves versioning. Depending on the system configuration, some application types have no parameters and cannot be edited.

**Counter Statistics** - opens the graphical editor and displays the counter statistics for the application using red counters in each object.

**Counter Reset** - resets the counters for the application.

**Detail Statistics** - shows the counter statistics for a particular interval defined in a popup window which is displayed when the function is selected. The results can alternatively be downloaded as a CSV file.

**Master Data** — shows the master data.

**Delete** - deletes this application or version.

Using the tab **Master Data** you can change the name of the application and the Test CLI (used to access the test version of the application).
