

Create routing application

To create a routing application use the function **Routing - Routing Applications** in the main menu and click on **New** in the toolbar. In the form, enter the following data:

Name	Give the application a representative name.
Application Type	Different application types are available, depending on the configuration of your system.
Test CLI	Provide the test CLI for calling the test version of the application.
Name of First Version	Give the application a representative name.
Set Active	Check this if the application should be immediately activated
Set Test	Check this if the test version of the application should be immediately activated

Use **Save** to save the data and return to the version control screen. Here, you can see all changes which have been made to the application, and set a particular version as active.

When you are programming an application, every time you save, a new version of the application is created, visible in the version control list. You can activate it for testing and renewed editing. Once you have created a “final” version of the application, you can clean up and delete versions you no longer require.

Alternatively to **New**, you can use **Copy** to copy an existing application. Choose the source application and provide a new name for the application.
