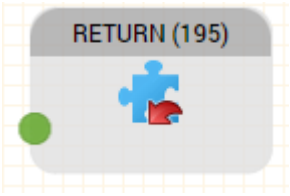
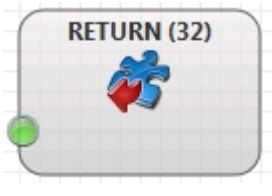
RETURN

as of release 3.27	prior to release 3.27
	




Function

Jumps from a routing application back to the calling routing application in which it was called with*GOSUB*. The return point is the point at which the routing application was left (the *GOSUB* object, output *Continue*). When returning, a ascertained value from the routing application can be passed back to the called routing application. This value is saved in the variable $return.

This object can only be used in applications, when the application was called using the *GOSUB* object. If it is used in an application even though it was called without GOSUB, the system is hanging up.

Parameters

Object Name	The name of this object instance
Result	Define a value, or the name of a variable, whose values should be passed back to the calling application. This value is saved in the variable $return.

This object has no outputs.
