

Declare Variable

Function

This object declares a variable. You can use this feature to save a value and use it later, for example in a comparison.

To overwrite an existing variable, simply use the function again.

Parameters

Object Name	The name of this object instance
Variable Name	The name of the variable to declare. You can access the variable later using <code>\$<name></code> .
Initial Value	Provide the initial value which should be given to the variable.

Outputs

Output	Used when ...
Continue	Always
