

# Alarms

Choose **Logging - Alerts** in the main menu, to view saved alert data.

Alerts are messages, that are automatically generated by the system, when certain functions fail or certain events occur. For example:

- The access to the FTP server is not available.
- A policy for the use of a service number (traffic management policy) was exceeded.

The maximum time for which alerts are kept by the system is restricted, the standard value is half a year.

In the column **Action** you can open the **Details** for an alert to view its data.
